User inputs an image
Image is read
The image is parsed into an array of RGB codes coinciding with the pixel dimensions of the image
Using nested for loops, the entire 2D array will be iterated through
If an RGB color is a certain color or within range of a color that coincides with the margin and ruled lines, it is replaced with white or a color that coincides with the color of the page
New image with edited colors is written and outputted
User downloads new image
